PGA112, PGA113, PGA116, PGA117

SBOS424C – MARCH 2008 – REVISED NOVEMBER 2015

PGA11x Zerø-Drift Programmable Gain Amplifier With Mux

1 Features

- Rail-to-Rail Input and Output
- Offset: 25 μV (Typical), 100 μV (Maximum)
- Zerø Drift: 0.35 μV/°C (Typical), 1.2 μV/°C (Maximum)
- Low Noise: 12 nV/√Hz
- Input Offset Current: ±5 nA Maximum (25°C)
- Gain Error: 0.1% Maximum (G ≤ 32), 0.3% Maximum (G > 32)
- Binary Gains: 1, 2, 4, 8, 16, 32, 64, 128 (PGA112, PGA116)
- Scope Gains: 1, 2, 5, 10, 20, 50, 100, 200 (PGA113, PGA117)
- Gain Switching Time: 200 ns
- 2 Channel MUX: PGA112, PGA113
  10 Channel MUX: PGA116, PGA117
- Four Internal Calibration Channels
- Amplifier Optimized for Driving CDAC ADCs
- Output Swing: 50 mV to Supply Rails
- AV_{DD} and DV_{DD} for Mixed Voltage Systems
- I_Q = 1.1 mA (Typical)
- Software and Hardware Shutdown: I_Q ≤ 4 μA (Typical)
- Temperature Range: –40°C to 125°C
- SPI™ Interface (10 MHz) With Daisy-Chain Capability

2 Applications

- Remote e-Meter Reading
- Automatic Gain Control
- Portable Data Acquisition
- PC-Based Signal Acquisition Systems
- Test and Measurement
- Programmable Logic Controllers
- Battery-Powered Instruments
- Handheld Test Equipment

3 Description

The PGA112 and PGA113 devices (binary and scope gains) offer two analog inputs, a three-pin SPI interface, and software shutdown in a 10-pin, VSSOP package. The PGA116 and PGA117 (binary and scope gains) offer 10 analog inputs, a SPI interface with daisy-chain capability, and hardware and software shutdown in a 20-pin TSSOP package.
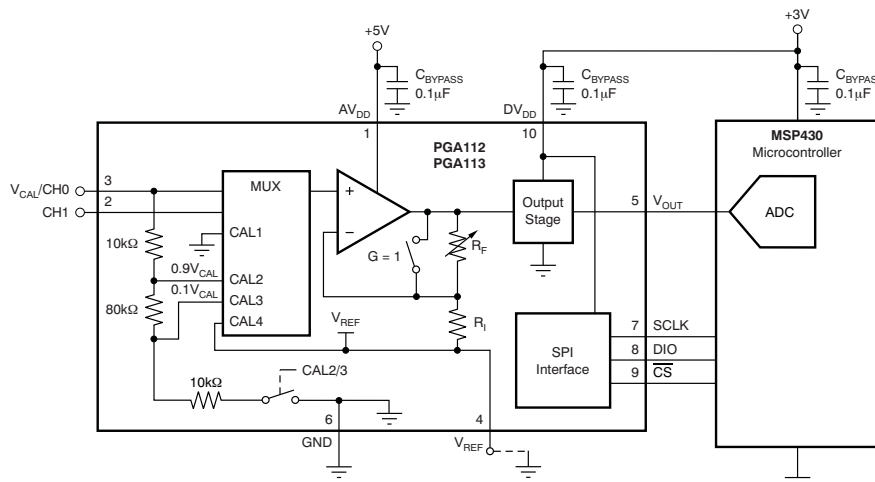

All versions provide internal calibration channels for system-level calibration. The channels are tied to GND, 0.9 V_{CAL}, 0.1 V_{CAL}, and V_{REF}, respectively. V_{CAL}, an external voltage connected to Channel 0, is used as the system calibration reference. Binary gains are: 1, 2, 4, 8, 16, 32, 64, and 128; scope gains are: 1, 2, 5, 10, 20, 50, 100, and 200.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
PGA112, PGA113	VSSOP (10)	3.00 mm × 3.00 mm
PGA116, PGA117	TSSOP (20)	6.50 mm × 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

PGA113	2	Scope	No	No	✓	VSSOP-10
PGA116	10	Binary	✓	✓	✓	TSSOP-20
PGA117	10	Scope	✓	✓	✓	TSSOP-20

6 Pin Configuration and Functions

DGS Package
10-Pin VSSOP
Top View

Pin	No.		No.	Pin
AV_{DD}	1		10	DV_{DD}
CH1	2		9	$\overline{CS}$
V_{CAL}/CH0	3	PGA112 PGA113	8	DIO
V_{REF}	4		7	SCLK
V_{OUT}	5		6	GND
## Pin Functions: PGA112, PGA113

PIN NO.	PIN NAME	I/O	DESCRIPTION
1	AV_{DD}	I	Analog supply voltage (2.2 V to 5.5 V)
2	CH1	I	Input MUX channel 1
3	V_{CAL}/CH0	I	Input MUX channel 0 and V_{CAL} input. For system calibration purposes, connect this pin to a low-impedance external reference voltage to use internal calibration channels. The four internal calibration channels are connected to GND, 0.9 V_{CAL}, 0.1 V_{CAL}, and V_{REF}, respectively. V_{CAL} is loaded with 100 kΩ (typical) when internal calibration channels CAL2 or CAL3 are selected. Otherwise, V_{CAL}/CH0 appears as high impedance.
4	V_{REF}	I	Reference input pin. Connect external reference for V_{OUT} offset shift or to midsupply for midsupply referenced systems. V_{REF} must be connected to a low-impedance reference capable of sourcing and sinking at least 2 mA or V_{REF} must be connected to GND.
5	V_{OUT}	O	Analog voltage output. When $AV_{DD} < DV_{DD}$, V_{OUT} is clamped to AV_{DD} + 300 mV.
6	GND	—	Ground pin
7	SCLK	I	Clock input for SPI serial interface
8	DIO	I	Data input/output for SPI serial interface. DIO contains a weak, 10-µA internal pulldown current source.
9	$\overline{CS}$	I	Chip select line for SPI serial interface
10	DV_{DD}	I	Digital and op amp output stage supply voltage (2.2 V to 5.5 V). Useful in multi-supply systems to prevent overvoltage and lockup condition on an analog-to-digital (ADC) input (for example, a microcontroller with an ADC running on 3 V and the PGA powered from 5 V). Digital I/O levels to be relative to DV_{DD}. DV_{DD} should be bypassed with a 0.1-µF ceramic capacitor, and DV_{DD} must supply the current for the digital portion of the PGA as well as the load current for the op amp output stage.

Pin Functions: PGA116, PGA117

PIN		I/O	DESCRIPTION
NO.	NAME		
1	AV_{DD}	I	Analog supply voltage (2.2 V to 5.5 V)
2	CH5	I	Input MUX channel 5
3	CH4	I	Input MUX channel 4
4	CH3	I	Input MUX channel 3
5	CH2	I	Input MUX channel 2
6	CH1	I	Input MUX channel 1
7	V_{CAL}/CH0	I	Input MUX channel 0 and V_{CAL} input. For system calibration purposes, connect this pin to a low-impedance external reference voltage to use internal calibration channels. The four internal calibration channels are connected to GND, 0.9 V_{CAL}, 0.1 V_{CAL}, and V_{REF}, respectively. V_{CAL} is loaded with 100 kΩ (typical) when internal calibration channels CAL2 or CAL3 are selected. Otherwise, V_{CAL}/CH0 appears as high impedance.
8	V_{REF}	I	Reference input pin. Connect external reference for V_{OUT} offset shift or to midsupply for midsupply referenced systems. V_{REF} must be connected to a low-impedance reference capable of sourcing and sinking at least 2 mA or to GND.
9	V_{OUT}	O	Analog voltage output. When $AV_{DD} < DV_{DD}$, V_{OUT} is clamped to AV_{DD} + 300 mV.
10	CH7	I	Input MUX channel 7
11	CH8	I	Input MUX channel 8
12	CH9	I	Input MUX channel 9
13	ENABLE	I	Hardware enable pin. Logic low puts the part into Shutdown mode (I_Q < 1 µA).
14	GND	—	Ground pin
15	SCLK	I	Clock input for SPI serial interface
16	DIN	I	Data input for SPI serial interface. DIN contains a weak, 10-µA internal pulldown current source to allow for ease of daisy-chain configurations.
17	DOUT	O	Data output for SPI serial interface. DOUT goes to high-Z state when $\overline{CS}$ goes high for standard SPI interface.
18	$\overline{CS}$	I	Chip select line for SPI serial interface
19	DV_{DD}	I	Digital and op amp output stage supply voltage (2.2 V to 5.5 V). Useful in multi-supply systems to prevent overvoltage and lockup condition on an ADC input (for example, a microcontroller with an ADC running on 3 V and the PGA powered from 5 V). Digital I/O levels to be relative to DV_{DD}. DV_{DD} should be bypassed with a 0.1-µF ceramic capacitor, and DV_{DD} must supply the current for the digital portion of the PGA as well as the load current for the op amp output stage.
20	CH6	I	Input MUX channel 6

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range, unless otherwise noted.[1]

	MIN	MAX	UNIT
Supply voltage		7	V
Signal input terminals, voltage[2]	GND – 0.5	AV_{DD} + 0.5	V
Signal input terminals, current[2]		±10	mA
Output short circuit	Continuous		
Operating temperature	–40	125	°C
Junction temperature		150	°C
Storage temperature	–65	150	°C

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be current-limited to 10 mA or less.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±3000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1000	
		Machine Model (MM)	±300	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
AV_{DD}	2.2	5	5.5	V
DV_{DD}	2.2	5	5.5	V
Operating temperature	–40	25	125	°C

7.4 Thermal Information

THERMAL METRIC[1]		PGA112, PGA113 DGS (VSSOP) 10 PINS	PGA116, PGA117 PW (TSSOP) 20 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	98.3	100.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	57	36.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	51.2	50.6	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.3	2.6	°C/W
ψ_{JB}	Junction-to-board characterization parameter	36.9	50.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	4.8	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

7.5 Electrical Characteristics: V_S = AV_{DD} = DV_{DD} = 5 V

at T_A = 25°C, R_L = 10kΩ//C_L = 100 pF connected to DV_{DD}/2, and V_{REF} = GND (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
OFFSET VOLTAGE

vs temperature, –40°C to 85°C		AV_{DD} = DV_{DD} = 5 V, V_{CM} = 4.5 V			0.3	1.3	µV/°C
vs power supply	PSRR	AV_{DD} = DV_{DD} = 2.2 V to 5.5 V, V_{CM} = 0.5 V, V_{REF} = V_{IN} = AV_{DD}/2			5	20	µV/V
Over temperature, –40°C to 125°C		AV_{DD} = DV_{DD} = 2.2 V to 5.5 V, V_{CM} = 0.5 V, V_{REF} = V_{IN} = AV_{DD}/2	T_A = –40°C to 125°C		5	40	µV/V
INPUT ON-CHANNEL CURRENT							
Input on-channel current (Ch0, Ch1)	I_{IN}	V_{REF} = V_{IN} = AV_{DD}/2			±1.5	±5	nA
Over temperature, –40°C to 125°C		V_{REF} = V_{IN} = AV_{DD}/2			See *Typical Characteristics*		nA
INPUT VOLTAGE RANGE							
Input voltage range[1]	I_{VR}			GND − 0.1		AV_{DD} + 0.1	V
Overvoltage input range		No output phase reversal[2]		GND − 0.3		AV_{DD} + 0.3	V
INPUT IMPEDANCE (Channel On)[3]							
Channel input capacitance	C_{CH}				2		pF
Channel switch resistance	R_{SW}				150		Ω
Amplifier input capacitance	C_{AMP}				3		pF
Amplifier input resistance	R_{AMP}	Input resistance to GND			10		GΩ
V_{CAL}/CH0	R_{IN}	CAL1 or CAL2 selected			100		kΩ
GAIN SELECTIONS							
Nominal gains		Binary gains: 1, 2, 4, 8, 16, 32, 64, 128		1		128	
		Scope gains: 1, 2, 5, 10, 20, 50, 100, 200		1		200	
DC gain error	G = 1	V_{OUT} = GND + 85 mV to DV_{DD} − 85 mV			0.006%	0.1%	
	1 < G ≤ 32	V_{OUT} = GND + 85 mV to DV_{DD} − 85 mV				0.1%	
	G ≥ 50	V_{OUT} = GND + 85 mV to DV_{DD} − 85 mV				0.3%	
DC gain drift	G = 1	V_{OUT} = GND + 85 mV to DV_{DD} − 85 mV	T_A = –40°C to 125°C		0.5		ppm/°C
	1 < G ≤ 32	V_{OUT} = GND + 85 mV to DV_{DD} − 85 mV	T_A = –40°C to 125°C		2		ppm/°C
	G ≥ 50	V_{OUT} = GND + 85 mV to DV_{DD} − 85 mV	T_A = –40°C to 125°C		6		ppm/°C
CAL2 DC gain error[4]		Op Amp + Input = 0.9 V_{CAL}, V_{REF} = V_{CAL} = AV_{DD}/2, G = 1			0.02%		
CAL2 DC gain drift[4]		Op Amp + Input = 0.9 V_{CAL}, V_{REF} = V_{CAL} = AV_{DD}/2, G = 1	T_A = –40°C to 125°C		2		ppm/°C
CAL3 DC gain error[4]		Op Amp + Input = 0.1 V_{CAL}, V_{REF} = V_{CAL} = AV_{DD}/2, G = 1			0.02%		
CAL3 DC gain drift[4]		Op Amp + Input = 0.1 V_{CAL}, V_{REF} = V_{CAL} = AV_{DD}/2, G = 1	T_A = –40°C to 125°C		2		ppm/°C
INPUT IMPEDANCE (CHANNEL OFF)[3]							
Input impedance	C_{CH}	See Figure 55			2		pF

(1) Gain error is a function of the input voltage. Gain error outside of the range (GND + 85 mV ≤ V_{OUT} ≤ DV_{DD} − 85 mV) increases to 0.5% (typical).
(2) Input voltages beyond this range must be current-limited to < |10 mA| through the input protection diodes on each channel to prevent permanent destruction of the device.
(3) See Figure 55.
(4) Total V_{OUT} error must be computed using input offset voltage error multiplied by gain. Includes op amp G = 1 error.

7.6 SPI Timing: V_S = AV_{DD} = DV_{DD} = 2.2 V to 5 V

At T_A = +25°C, R_L = 10kΩ//C_L = 100pF connected to DV_{DD}/2, and V_{REF} = GND, unless otherwise noted.

|			MIN	NOM	MAX	UNIT
	Input capacitance (SCLK, $\overline{CS}$, and DIO pins)			1		pF
t_{RFI}	Input rise and fall time[1] ($\overline{CS}$, SCLK, and DIO pins)				2	µs
t_{RFO}	Output rise and fall time (DIO pin)[1]	C_{LOAD} = 60 pF			10	ns
t_{CSH}	$\overline{CS}$ high time ($\overline{CS}$ pin)[1]		40			ns
t_{CSO}	SCLK edge to $\overline{CS}$ fall setup time[1]		10			ns
t_{CSSC}	$\overline{CS}$ fall to first SCLK edge setup time		10			ns
f_{SCLK}	SCLK Frequency[2]				10	MHz
t_{HI}	SCLK high time[3]		40			ns
t_{LO}	SCLK low time[3]		40			ns
t_{SCCS}	SCLK last edge to $\overline{CS}$ rise setup time[1]		10			ns
t_{CS1}	$\overline{CS}$ rise to SCLK edge setup time[1]		10			ns
t_{SU}	DIN setup time		10			ns
t_{HD}	DIN hold time		10			ns
t_{DO}	SCLK to DOUT valid propagation delay[1]				25	ns
t_{SOZ}	$\overline{CS}$ rise to DOUT forced to Hi-Z[1]				20	ns

(1) Ensured by design; not production tested.
(2) When using devices in daisy-chain mode, the maximum clock frequency for SCLK is limited by SCLK rise and fall time, DIN setup time, and DOUT propagation delay. See Figure 61. Based on this limitation, the maximum SCLK frequency for daisy-chain mode is 9.09 MHz.
(3) t_{HI} and t_{LO} must not be less than 1/SCLK (maximum).

8 Detailed Description

8.1 Overview

The PGA112 and PGA113 devices (binary and scope gains) offer two analog inputs, a three-pin SPI interface, and software shutdown in an 10-pin VSSOP package. The PGA116 and PGA117 (binary and scope gains) offer 10 analog inputs, and hardware and software shutdown in a 20-pin TSSOP package.

All versions provide internal calibration channels for system-level calibration. The channels are tied to GND, 0.9 V_{CAL}, 0.1 V_{CAL}, and V_{REF}, respectively. V_{CAL}, an external voltage connected to Channel 0, is used as the system calibration reference. Binary gains are: 1, 2, 4, 8, 16, 32, 64, and 128; scope gains are: 1, 2, 5, 10, 20, 50, 100, and 200.

The PGA uses a SPI interface with daisy-chain capability, a standard serial peripheral interface (SPI). Both SPI Mode 0,0 and Mode 1,1 are supported, as shown in Figure 56 and described in Table 2.

8.2 Functional Block Diagram
8.3 Feature Description

Featuring low offset, low offset drift and low noise, the PGA11x series provides a flexible analog building block for a variety of applications. The PGA112 and PGA116 offer binary gains of 1, 2, 4, 8, 16, 32, 64, 128 and a 2 channel MUX while the PGA113 and PGA117 offer scope gains of 1, 2, 5, 10, 20, 50, 100, 200 and a 10 channel MUX.

8.4 Device Functional Modes

The PGA112 and PGA113 devices have a software shutdown mode, and the PGA116 and PGA117 devices offer both a hardware and software shutdown mode, see *Shutdown and Power-On-Reset (POR)* for additional information. The PGA uses a standard serial peripheral interface (SPI). Both SPI Mode 0,0 and Mode 1,1 are supported. More information regarding serial communications, including daisy chaining can be found in *Serial Interface Information*.

Serial Interface Information (continued)

Table 2. SPI Mode Setting Description

MODE	CPOL	CPHA	CPOL DESCRIPTION	CPHA DESCRIPTION
0, 0	0	0[1]	Clock idles low	Data are read on the rising edge of clock. Data change on the falling edge of clock.
1, 1	1	1[2]	Clock idles high	Data are read on the rising edge of clock. Data change on the falling edge of clock.

(1) CPHA = 0 means sample on first clock edge (rising or falling) after a valid $\overline{CS}$.
(2) CPHA = 1 means sample on second clock edge (rising or falling) after a valid $\overline{CS}$.

8.6.1 Serial Digital Interface: SPI Modes

The PGA uses a standard serial peripheral interface (SPI). Both SPI Mode 0,0 and Mode 1,1 are supported, as shown in Figure 56 and described in Table 2.

If there are not even-numbered increments of 16 clocks (that is, 16, 32, 64, and so forth) between $\overline{CS}$ going low (falling edge) and $\overline{CS}$ going high (rising edge), the device takes no action. This condition provides reliable serial communication. Furthermore, this condition also provides a way to quickly reset the SPI interface to a known starting condition for data synchronization. Transmitted data are latched internally on the rising edge of $\overline{CS}$.

On the PGA116 and PGA117 devices, $\overline{CS}$, DIN, and SCLK are Schmitt-triggered CMOS logic inputs. DIN has a weak internal pulldown to support daisy-chain communications on the PGA116 and PGA117 devices. DOUT is a CMOS logic output. When $\overline{CS}$ is high, the state of DOUT is high-impedance. When $\overline{CS}$ is low, DOUT is driven as illustrated in Figure 57.
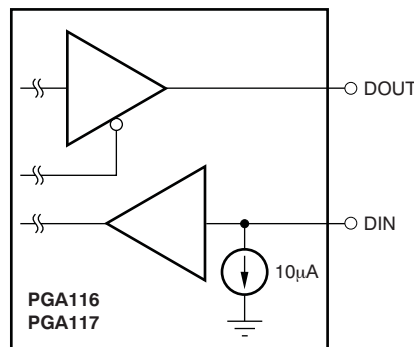

Figure 57. Digital I/O Structure—PGA116 and PGA117

On the PGA112 and PGA113 devices, there are digital output and digital input gates both internally connected to the DIO pin. DIN is an input-only gate and DOUT is a digital output that can give a 3-state output. The DIO pin has a weak 10-µA pulldown current source to prevent the pin from floating in systems with a high-impedance SPI DOUT line. When $\overline{CS}$ is high, the state of the internal DOUT gate is high-impedance. When $\overline{CS}$ is low, the state of DIO depends on the previous valid SPI communication; either DIO becomes an output to clock out data or it remains an input to receive data. This structure is shown in Figure 58.
Figure 58. Digital I/O Structure—PGA112 and PGA113

Product Folder Links: *PGA112 PGA113 PGA116 PGA117*

8.6.2 Serial Digital Interface: SPI Daisy-Chain Communications

To reduce the number of I/O port pins used on a microcontroller, the PGA116 and PGA117 support SPI daisy-chain communications with full read and write capability. A two-device daisy-chain configuration is shown in Figure 59, although any number of devices can be daisy-chained. The SPI daisy-chain communication uses a common SCLK and $\overline{CS}$ line for all devices in the daisy chain, rather than each device requiring a separate $\overline{CS}$ line. The daisy-chain mode of communication routes data serially through each device in the chain by using its respective DIN and DOUT pins as shown. Special commands are used (see Table 4) to ensure that data are written or read in the proper sequence. There is a special daisy-chain NOP command (No OPeration) which, when presented to the desired device in the daisy-chain, causes no changes in that respective device. Detailed timing diagrams for daisy-chain operation are shown in Figure 63 through Figure 65.
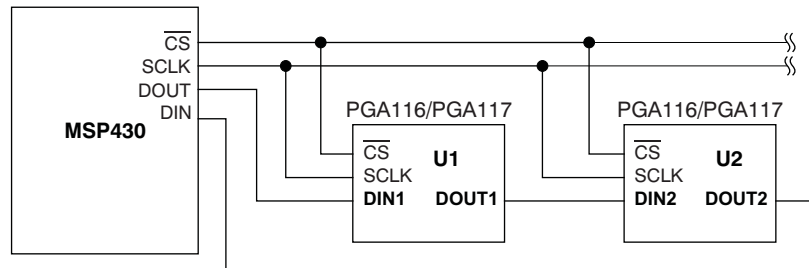

Figure 59. Daisy-Chain Read and Write Configuration

The PGA112 and PGA113 devices can be used as the last device in a daisy-chain as shown in Figure 60 if *write-only* communication is acceptable, because the PGA112 and PGA113 devices have no separate DOUT pin to connect back to the microcontroller DIN pin to read back data in this configuration.
Figure 60. Daisy-Chain Write-Only Configuration

The maximum SCLK frequency that can be used in daisy-chain operation is directly related to SCLK rise and fall times, DIN setup time, and DOUT propagation delay. Any number of two or more devices have the same limitations because it is the timing considerations between adjacent devices that limit the clock speed.

Figure 61 analyzes the maximum SCLK frequency for daisy-chain mode based on the circuit of Figure 59. A clock rise and fall time of 10 ns is assumed to allow for extra bus capacitance that could occur as a result of multiple devices in the daisy-chain.
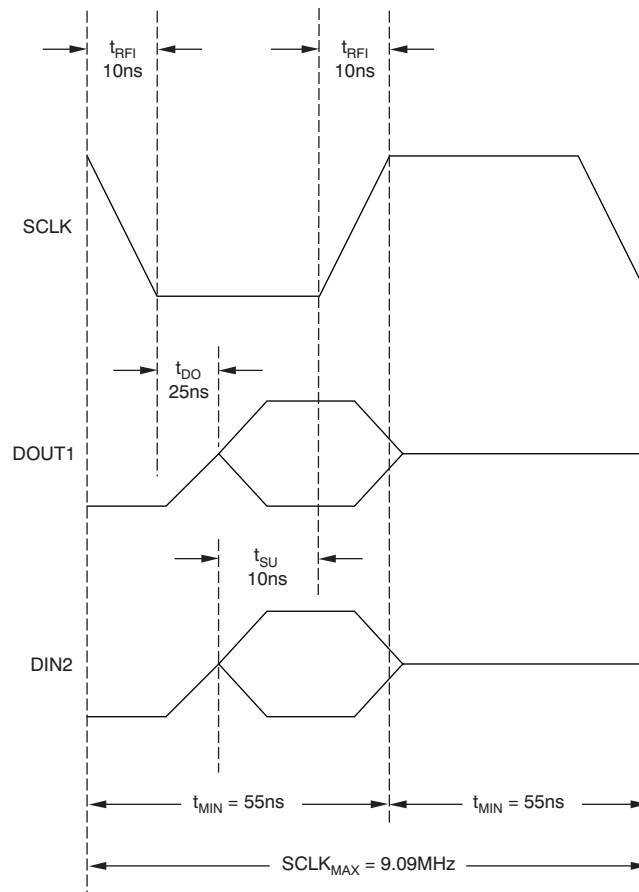

Figure 61. Daisy-Chain Maximum SCLK Frequency

9 Applications and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The PGA11x family of devices are single-ended input, single-supply, programmable gain amplifiers (PGAs) with an input multiplexer. Multiplexer channel selection and gain selection are done through a standard SPI interface. The PGA112 and PGA113 have a two-channel input MUX and the PGA116 and PGA117 devices have a 10-channel input MUX. The PGA112 and PGA116 devices provide binary gain selections (1, 2, 4, 8, 16, 32, 64, 128) and the PGA113 and PGA117 devices provide scope gain selections (1, 2, 5, 10, 20, 50, 100, 200). All models use a split-supply architecture with an analog supply, AV_{DD}, and a digital supply, DV_{DD}. This split-supply architecture allows for ease of interface to analog-to-digital converters (ADCs) and microcontrollers in mixed-supply voltage systems, such as where the analog supply is 5 V and the digital supply is 3 V. Four internal calibration channels are provided for system-level calibration. The channels are tied to GND, 0.9 V_{CAL}, 0.1 V_{CAL}, and V_{REF}, respectively. V_{CAL}, an external voltage connected to V_{CAL}/CH0, acts as the system calibration reference. If V_{CAL} is the system ADC reference, then gain and offset calibration on the ADC are easily accomplished through the PGA11x devices using only one MUX input. If calibration is not used, then V_{CAL}/CH0 can be used as a standard MUX input. All four versions provide a V_{REF} pin that can be tied to ground or, for ease of scaling, to midsupply in single-supply systems where midsupply is used as a virtual ground. The PGA112 and PGA113 devices offer a software-controlled shutdown feature for low standby power. The PGA116 and PGA117 devices offer both hardware- and software-controlled shutdown for low standby power. The PGA112 and PGA113 devices have a 3-wire SPI digital interface; the PGA116 and PGA117 devices have a four-wire SPI digital interface. The PGA116 and PGA117 devices also have daisy-chain capability.

9.1.1 Op Amp: Input Stage

The PGA op amp is a rail-to-rail input and output (RRIO) single-supply op amp. The input topology uses two separate input stages in parallel to achieve rail-to-rail input. As Figure 66 shows, there is a PMOS transistor on each input for operation down to ground; there is also an NMOS transistor on each input in parallel for operation to the positive supply rail. When the common-mode input voltage (that is, the single-ended input, because this PGA is configured internally for noninverting gain) crosses a level that is typically about 1.5 V less than the positive supply, there is a transition between the NMOS and PMOS transistors. The result of this transition appears as a small input offset voltage transition that is reflected to the output by the selected PGA gain. This transition may be either increasing or decreasing, and differs from part to part as described in Figure 67 and Figure 68. These figures illustrate possible differences in input offset voltage between two different devices when used with AV_{DD} = 5 V. Because the exact transition region varies from device to device, the *Electrical Characteristics: $V_S = AV_{DD} = DV_{DD} = 5$ V* table specifies an input offset voltage above and below this input transition region.

Application Information (continued)
Figure 66. PGA Rail-To-Rail Input Stage
Figure 67. V$_{OS}$ Versus Input Voltage—Case 1
Figure 68. V$_{OS}$ Versus Input Voltage—Case 2

9.1.2 Op Amp: General Gain Equations

Figure 69 shows the basic configuration for using the PGA as a gain block. V$_{OUT}$ / V$_{IN}$ is the selected noninverting gain, depending on the model selected, for either binary or scope gains.

Application Information (continued)
Figure 69. PGA Used as a Gain Block

$$V_{OUT} = G \times V_{IN}$$

where

- G = 1, 2, 4, 8, 16, 32, 64, and 128 (binary gains)
- G = 1, 2, 5, 10, 20, 50, 100, and 200 (scope gains)   (1)

Figure 70 shows the PGA configuration and gain equations for $V_{REF} = AV_{DD}/2$. V_{OUT0} is V_{OUT} when CH0 is selected and V_{OUT1} is V_{OUT} when CH1 is selected. Notice the V_{REF} pin has no effect for G = 1 because the internal feedback resistor, R_F, is shorted out. This configuration allows for positive and negative voltage excursions around a midsupply virtual ground.
Figure 70. PGA112 and PGA113 Configuration for Positive and Negative Excursions Around Midsupply Virtual Ground

$$V_{OUT0} = G \times V_{IN0} - AV_{DD}/2 \times (G - 1)$$ (2)

When: G = 1

Then: $V_{OUT0} = G \times V_{IN0}$

$$V_{OUT1} = G \times (V_{IN1} + AV_{DD}/2) - AV_{DD}/2 \times (G - 1)$$
$$V_{OUT1} = G \times V_{IN1} + AV_{DD}/2, \text{ where: } -AV_{DD}/2 < G \times V_{IN1} < +AV_{DD}/2$$

where

- G = 1, 2, 4, 8, 16, 32, 64, and 128 (binary gains)
- G = 1, 2, 5, 10, 20, 50, 100, and 200 (scope gains)   (3)

Table 7 details the internal typical values for the op amp internal feedback resistor (R_F) and op amp internal input resistor (R_I) for both binary and scope gains.

Application Information (continued)

Table 7. Typical R$_F$ and R$_I$ Versus Gain

BINARY GAIN (V/V)	R$_F$ (Ω)	R$_I$ (Ω)	SCOPE GAIN (V/V)	R$_F$ (Ω)	R$_I$ (Ω)
1	0	3.25 k	1	0	3.25 k
2	3.25 k	3.25 k	2	3.25 k	3.25 k
4	9.75 k	3.25 k	5	13 k	3.25 k
8	22.75 k	3.25 k	10	29.25 k	3.25 k
16	48.75 k	3.25 k	20	61.75 k	3.25 k
32	100.75 k	3.25 k	50	159.25 k	3.25 k
64	204.75 k	3.25 k	100	321.75 k	3.25 k
128	412.75 k	3.25 k	200	646.75 k	3.25 k

9.1.3 Op Amp: Frequency Response Versus Gain

Table 8 documents how small-signal bandwidth and slew rate change correspond to changes in PGA gain.

Full power bandwidth (that is, the highest frequency that a sine wave can pass through the PGA for a given gain) is related to slew rate by Equation 4:

$$SR\ (V/\mu s) = 2\pi f \times V_{OP}\ (1 \times 10^{-6})$$

where

- SR = Slew rate in V/µs
- f = Frequency in Hz
- V$_{OP}$ = Output peak voltage in volts

(4)

9.1.3.1 Example:

For G = 8, then SR = 10.6 V/µs (slew rate rise is minimum slew rate).

For a 5-V system, choose 0.1 V < V$_{OUT}$ < 4.9 V or V$_{OUTPP}$ = 4.8 V or V$_{OUTP}$ = 2.4 V.

SR (V/µs) = 2πf × V$_{OP}$ (1 × 10^{-6}).

10.6 = 2πf (2.4) (1 × 10^{-6}) → f = 702.9 kHz

This example shows that a G = 8 configuration can produce a 4.8-V$_{PP}$ sine wave with frequency up to 702.9 kHz. This computation only shows the theoretical upper limit of frequency for this example, but does not indicate the distortion of the sine wave. The acceptable distortion depends on the specific application. As a general guideline, maintain two to three times the calculated slew rate to minimize distortion on the sine wave. For this example, the application should only use G = 8, 4.8 V$_{PP}$, up to a frequency range of 234 kHz to 351 kHz, depending upon the acceptable distortion. For a given gain and slew rate requirement, check for adequate small-signal bandwidth (typical −3-dB frequency) to assure that the frequency of the signal can be passed without attenuation.

9.1.4 Analog MUX

The analog input MUX provides two input channels for the PGA112 and PGA113 devices and 10 input channels for the PGA116 and PGA117 devices. The MUX switches are designed to be break-before-make and thereby eliminate any concerns about shorting the two input signal sources together.

Four internal MUX CAL channels are included in the analog MUX for ease of system calibration. These CAL channels allow ADC gain and offset errors to be calibrated out. This calibration does not remove the offset and gain errors of the PGA for gains greater than 1, but most systems should see a significant increase in the ADC accuracy. In addition, these CAL channels can be used by the ADC to read the minimum and maximum possible voltages from the PGA. With these minimum and maximum levels known, the system architecture can be designed to indicate an out-of-range condition on the measured analog input signals if these levels are ever measured.

To use the CAL channels, V_{CAL}/CH0 must be permanently connected to the system ADC reference. There is a typical 100-kΩ load from V_{CAL}/CH0 to ground. Table 9 illustrates how to use the CAL channels with V_{REF} = ground. Table 10 describes how to use the CAL channels with V_{REF} = AV_{DD}/2. The V_{REF} pin must be connected to a source that is low-impedance for both DC and AC to maintain gain and nonlinearity accuracy. Worst-case current demand on the V_{REF} pin occurs when G = 1 because there is a 3.25-kΩ resistor between V_{OUT} and V_{REF}. For a 5-V system with AV_{DD}/2 = 2.5 V, the V_{REF} pin buffer must source and sink 2.5 V/3.25 kΩ = 0.7 mA minimum for a V_{OUT} that can swing from ground to 5 V.

Table 8. Frequency Response versus Gain (C_L = 100 pf, R_L = 10 kω)

9.1.5 System Calibration Using The PGA

Analog-to-digital converters (ADCs) contain two major errors that can be easily removed by calibration at a system level. These errors are gain error and offset error, as shown in Figure 73. Figure 73 shows a typical transfer function for a 12-bit ADC. The analog input is on the x-axis with a range from 0 V to (V$_{REF\_ADC}$ − 1LSB), where V$_{REF\_ADC}$ is the ADC reference voltage. The y-axis is the hexadecimal equivalent of the digital codes that result from ADC conversions. The dotted red line represents an ideal transfer function with *0000h* representing 0 V analog input and *0FFFh* representing an analog input of (V$_{REF\_ADC}$ − 1LSB). The solid blue line illustrates the offset error. Although the solid blue line includes both offset error and gain error, at an analog input of 0 V the offset error voltage, V$_{Z\_ACTUAL}$, can be measured. The dashed black line represents the transfer function with gain error. The dashed black line is equivalent to the solid blue line without the offset error, and can be measured and computed using V$_{Z\_ACTUAL}$ and V$_{Z\_IDEAL}$. The difference between the dashed black line and the dotted red line is the gain error. Gain and offset error can be computed by taking zero input and full-scale input readings. Using these error calculations, compute a calibrated ADC reading to remove the ADC gain and offset error.
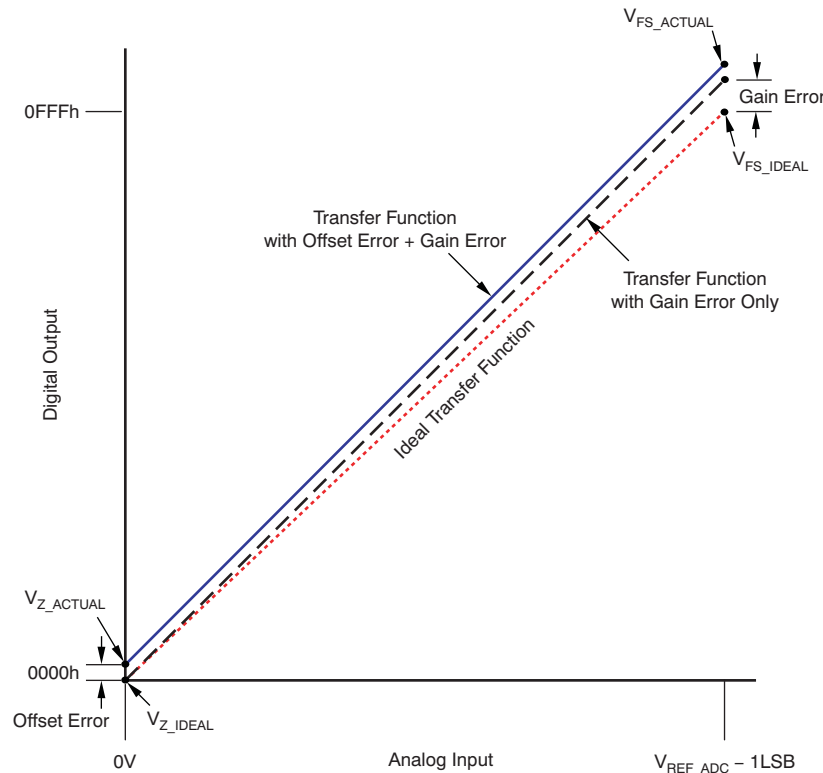

Figure 73. ADC Offset and Gain Error

In practice, the zero input (0 V) or full-scale input (V_{REF_ADC} − 1LSB) of ADCs cannot always be measured because of internal offset error and gain error. However, if measurements are made very close to the full-scale input and the zero input, both zero and full-scale can be calibrated very accurately with the assumption of linearity from the calibration points to the desired end points of the ADC ideal transfer function. For the zero calibration, choose 10%V_{REF_ADC}; this value should be above the internal offset error and sufficiently out of the noise floor range of the ADC. For the gain calibration, choose 90%V_{REF_ADC}; this value should be less than the internal gain error and sufficiently below the tolerance of V_{REF}. These key points can be summarized in this way:

For zero calibration:

- The ADC cannot read the ideal zero because of offset error
- Must be far enough above ground to be above noise floor and ADC offset error
- Therefore, choose 10%V_{REF_ADC} for zero calibration

For gain calibration:

- The ADC cannot read the ideal full-scale because of gain error
- Must be far enough below full-scale to be below the V_{REF} tolerance and ADC gain error
- Therefore, choose 90%V_{REF_ADC} for gain calibration

The 12-bit ADC example in Figure 74 illustrates the technique for calibrating an ADC using a 10%V_{REF_ADC} and 90%V_{REF_ADC} reading where V_{REF_ADC} is the ADC reference voltage. The 10%V_{REF} reading also contains a gain error because it is not a V_{IN} = 0 calibration point. First, use the 90%V_{REF} and 10%V_{REF} points to compute the measured gain error. The measured gain error is then used to remove the gain error from the 10%V_{REF} reading, giving a measured 10%V_{REF} number. The measured 10%V_{REF} number is used to compute the measured offset error.

Product Folder Links: *PGA112 PGA113 PGA116 PGA117*
Figure 74. 12-Bit Example of ADC Calibration for Gain and Offset Error

The gain error and offset error in ADC readings can be calibrated by using 10%V_{REF_ADC} and 90%V_{REF_ADC} calibration points. Because the calibration is ratiometric to V_{REF_ADC}, the exact value of V_{REF_ADC} does not need to be known in the end application.

Follow these steps to compute a calibrated ADC reading:

1. Take the ADC reading at V_{IN} = 90% × V_{REF} and V_{IN} = 10% × V_{REF}. The ADC readings for 10%V_{REF} and 90%V_{REF} are taken.

$$V_{REF}90 = 0.9(V_{REF\_ADC})$$ (5)

$$V_{REF}10 = 0.1(V_{REF\_ADC})$$ (6)

$$V_{MEAS}90 = ADC_{MEASUREMENT} \text{ at } V_{REF}90$$ (7)

$$V_{MEAS}10 = ADC_{MEASUREMENT} \text{ at } V_{REF}10$$ (8)

2. Compute the ADC measured gain. The slope of the curve connecting the measured 10%V_{REF} and measured 90%V_{REF} point is computed and compared to the slope between the ideal 10%V_{REF} and ideal 90%V_{REF}. This result is the measured gain.

$$G_{MEAS} = \frac{V_{MEAS}90 - V_{MEAS}10}{V_{REF}90 - V_{REF}10}$$ (9)

3. Compute the ADC measured offset. The measured offset is computed by taking the difference between the measured 10%V_{REF} and the (ideal 10%V_{REF}) × (measured gain).

$$O_{MEAS} = V_{MEAS}10 - (V_{REF}10 \times G_{MEAS})$$ (10)

4. Compute the calibrated ADC readings.

$$V_{AD\_MEAS} = \text{Any } V_{IN} \text{ } ADC_{MEASUREMENT}$$ (11)

$$V_{ADC\_CAL} = \frac{V_{AD\_MEAS} - O_{MEAS}}{G_{MEAS}}$$ (12)

Any ADC reading can therefore be calibrated by removing the gain error and offset error. The measured offset is subtracted from the ADC reading and then divided by the measured gain to give a corrected reading. If this calibration is performed on a timed basis, relative to the specific application, gain and offset error over temperature are also removed from the ADC reading by calibration.

For example; given:

• 12-Bit ADC
• ADC Gain Error = 6 LSB
• ADC Offset Error = 4 LSB
• ADC Reference (V_{REF_ADC}) = 5 V
• Temperature = 25°C

Table 11 shows the resulting system accuracy.

Table 11. Bits of System Accuracy[1] (To 0.5 LSB)

V_{IN}	ADC ACCURACY WITHOUT CALIBRATION	ADC ACCURACY WITH PGA112 CALIBRATION
10%V_{REF_ADC}	8.80 Bits	12.80 Bits
90%V_{REF_ADC}	7.77 Bits	11.06 Bits

(1)   Difference in maximum input offset voltage for V_{IN} = 10%V_{REF_ADC} and V_{IN} = 90%V_{REF_ADC} is the reason for different accuracies.

9.1.6 Driving and Interfacing to ADCs

CDAC SAR ADCs contain an input sampling capacitor, C_{SH}, to sample the input signal during a sample period as shown in Figure 75. After the sample period, C_{SH} is removed from the input signal. Subsequent comparisons of the charge stored on C_{SH} are performed during the ADC conversion process. To achieve optimal op amp stability, input signal settling, and the demands for charge from the input signal conditioning circuitry, most ADC applications are optimized by the use of a resistor (R_{FILT}) and capacitor (C_{FILT}) filter placed between the op amp output and ADC input. For the PGA112 and PGA113 devices, or the PGA116 and PGA117 devices, setting C_{FILT} = 1 nF and R_{FILT} = 100 Ω yields optimum system performance for sampling converters operating at speeds up to 500 kHz, depending upon the application settling time and accuracy requirements.
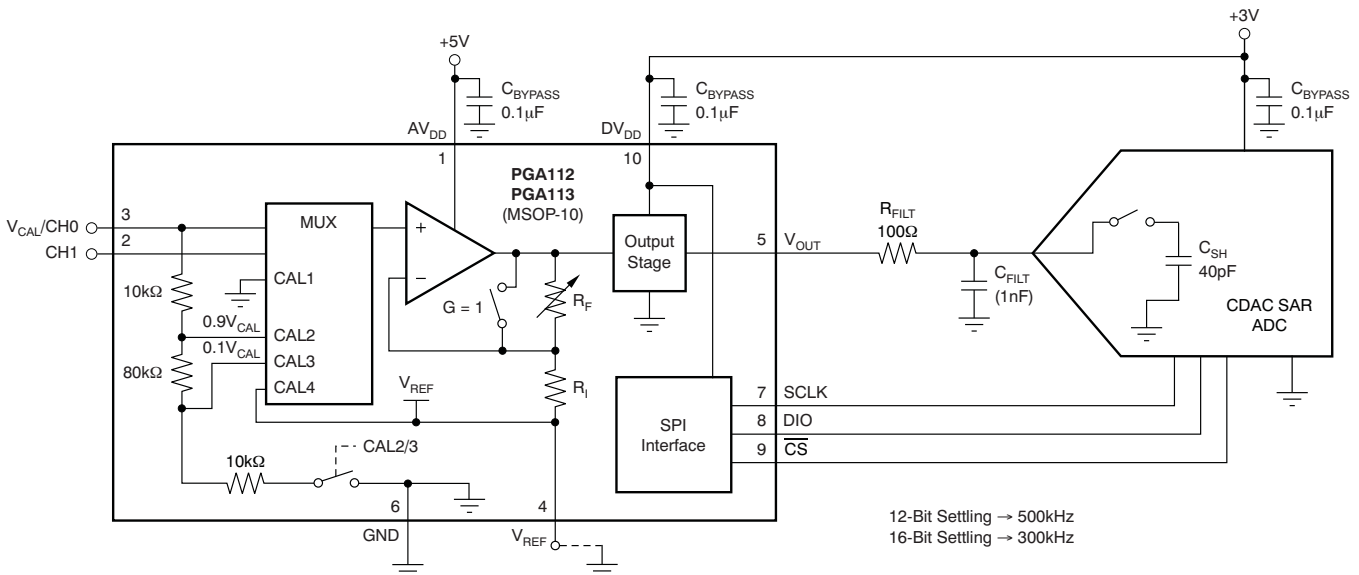

Figure 75. Driving and Interfacing to ADCs

Product Folder Links: *PGA112 PGA113 PGA116 PGA117*

9.1.7 Power Supplies

Figure 76 shows a typical mixed-supply voltage system where the analog supply, AV_{DD}, is 5 V and the digital supply voltage, DV_{DD}, is 3 V. The analog output stage of the PGA and the SPI interface digital circuitry are both powered from DV_{DD}. When considering the power required for DV_{DD}, use the *Electrical Characteristics: $V_S = AV_{DD} = DV_{DD} = 5$ V* table and add any load current anticipated on V_{OUT}; this load current must be provided by DV_{DD}. This split-supply architecture ensures compatible logic levels with the microcontroller. It also ensures that the PGA output cannot run the input for the onboard ADC into an overvoltage condition; this condition could cause device latch-up and system lock-up, and require power-supply sequencing. Each supply pin should be individually bypassed with a 0.1 µF ceramic capacitor directly at the device to ground. If there is only one power supply in the system, AV_{DD} and DV_{DD} can both be connected to the same supply; however, TI recommends using individual bypass capacitors directly at each respective supply pin to a single point ground. V_{OUT} is diode-clamped to AV_{DD} (as shown in Figure 76); therefore, set DV_{DD} less than or equal to $AV_{DD} + 0.3$ V. DV_{DD} and AV_{DD} must be within the operating voltage range of 2.2 V to 5.5 V.

At initial power-on, the state of the PGA is G = 1 and Channel 0 active.

NOTE

For most applications, set $AV_{DD} \geq DV_{DD}$ to prevent V_{OUT} from driving current into AV_{DD} and raising the voltage level of AV_{DD}

9.1.8 Shutdown and Power-On-Reset (POR)

The PGA112 and PGA113 devices have a software shutdown mode, and the PGA116 and PGA117 devices offer both a hardware and software shutdown mode. When the PGA11x is shut down, it goes into a low-power standby mode. The *Electrical Characteristics: $V_S = AV_{DD} = DV_{DD} = 5$ V* table details the current draw in shutdown mode with and without the SPI interface being clocked. In shutdown mode, R_F and R_I remain connected between V_{OUT} and V_{REF}.

When DV_{DD} is less than 1.6 V, the digital interface is disabled and the channel and gain selections are held to the respective POR states of Gain = 1 and Channel = V_{CAL}/CH0. When DV_{DD} is above 1.8 V, the digital interface is enabled and the POR gain and channel states remain unchanged until a valid SPI communication is received.

(1) Scaling is based on 0.02(V_{REF_ADC}) to 0.98(V_{REF_ADC}), using standard 0.1% resistor values.
(2) Assumes symmetrical V_{IN} and symmetrical scaling for CH1 input minimum and maximum.

Product Folder Links: *PGA112 PGA113 PGA116 PGA117*

9.2.1.2 Detailed Design Procedure

This process assumes a symmetrical V_{IN1} and that symmetrical scaling is used for CH1 input minimum and maximum values. The following steps give the algorithm to compute resistor values for references not listed in Table 12.

Step 1: Choose the following:

a. V_{REF_ADC} = 2.5 V (ADC reference voltage)

b. $|V_{IN1}|$ = 5

   (magnitude of V_{IN}, assuming scaling is for $\pm V_{IN1}$)

c. Choose R_B as a standard resistor value. The input on-channel current multiplied by R_B should be less than the input offset voltage, such that R_B is not a major source of inaccuracy.

   R_B = 10 kΩ (select as a starting value for resistors)

d. For the most negative V_{IN1}, choose the percentage (in decimal format) of V_{REF_ADC} desired at the ADC input.

   k_{VO-} = 0.02

   (CH1 input = $k_{VO-} \times V_{REF\_ADC}$ when V_{IN1} = $-V_{IN1}$)

e. For the most positive V_{IN1}, choose the percentage (in decimal format) of V_{REF_ADC} desired at the ADC input. Because this scaling is based on symmetry, k_{VO+} must be the same percentage away from V_{REF_ADC} at the upper limit as at the lower limit where k_{VO-} is computed.

   k_{VO+} = 1 − k_{VO-}

   k_{VO+} = 1 − 0.02 = 0.98

   (CH1 input = $k_{VO+} \times V_{REF\_ADC}$ when V_{IN1} = $+V_{IN1}$)

Step 2: Compute the following:

a. To simplify analysis, create one constant called k_{VO}.

   k_{VO} = k_{VO+} − k_{VO-}
   0.96 = 0.98 − 0.02   (13)

b. A constant, g, is created to simplify resistor value computations.

$$g = \frac{k_{VO} \times V_{REF\_ADC}}{2 \times |V_{IN1}| - k_{VO} \times V_{REF\_ADC}}$$

$$0.315789474 = \frac{0.96 \times 2.5}{2 \times 5 - 0.96 \times 2.5}$$ (14)

c. R_A is now selected from the starting value of R_B and the g constant.

$$R_A = \frac{2 \times R_B \times g}{1 - g}$$

$$9.23077k\Omega = \frac{2 \times 10k\Omega \times 0.315789474}{1 - 0.315789474}$$ (15)

d. R_X can now be computed from the starting value of R_B and the computed value for R_A.

$$R_X = \frac{R_B \times R_A}{R_B + R_A}$$

$$4.81k\Omega = \frac{10k\Omega \times 9.23077k\Omega}{10k\Omega + 9.23077k\Omega}$$ (16)

9.2.1.3 Application Curve
Figure 80. Voltage (V) vs Time (s)

9.2.2 Typical Application: General-Purpose Input Scaling

Figure 81 is an example application that demonstrates the flexibility of the PGA for general-purpose input scaling. V_{IN0} is a ±100-mV input that is ac-coupled into CH0. The PGA112 and PGA113 are powered from a 5-V supply voltage, V_S, and configured with the V_{REF} pin connected to $V_S/2$ (2.5 V). V_{CH0} is the ±100-mV input, level-shifted and centered on $V_S/2$ (2.5 V). A gain of 20 is applied to CH0, and because of the PGA113 configuration, the output voltage at V_{OUT} is ±2 V centered on $V_S/2$ (2.5 V).

CH1 is set to G = 1; through a resistive divider and scalar network, we can read ±5 V or 0 V. This setting provides bipolar to single-ended input scaling. Table 12 summarizes the scaling resistor values for R_A, R_X, and R_B for different ADC Ref voltages. V_{REF_ADC} is the reference voltage used for the ADC connected to the PGA112 and PGA113 output. It is assumed the ADC input range is 0 V to V_{REF_ADC}. The Table 12 section gives the algorithm to compute resistor values for references not listed in Table 12. As a general guideline, R_B should be chosen such that the input on-channel current multiplied by R_B is less than or equal to the input offset voltage. This value ensures that the scaling network contributes no more error than the input offset voltage. Individual applications may require other design trade-offs.
Figure 81. General-Purpose Input Scaling

10 Power Supply Recommendations

Power-supply bypass: Bypass each power-supply pin separately. Use a ceramic capacitor connected directly from the power-supply pin to the ground pin of the IC on the same PCB plane. Vias can then be used to connect to ground and voltage planes. This configuration keeps parasitic inductive paths out of the local bypass for the PGA. Good analog design practice dictates the use of a large value tantalum bypass capacitor on the PCB for each respective voltage.

Product Folder Links: *PGA112 PGA113 PGA116 PGA117*

11 Layout

11.1 Layout Guidelines

11.1.1 High Gain and Wide Bandwidth Considerations

As a result of the combination of wide bandwidth and high gain capability of the PGA112 and PGA113 devices and PGA116 and PGA117 devices, there are several printed-circuit-board (PCB) design and system recommendations to consider for optimum application performance.

1. **Power-supply bypass:** Refer to *Power Supply Recommendations*.
2. **Signal trace routing:** Keep V_{OUT} and other low impedance traces away from MUX channel inputs that are high impedance. Poor signal routing can cause positive feedback, unwanted oscillations, or excessive overshoot and ringing on step-changing signals. If the input signals are particularly noisy, separate MUX input channels with guard traces on either side of the signal traces. Connect the guard traces to ground near the PGA and at the signal entry point into the PCB. On multilayer PCBs, ensure that there are no parallel traces near MUX input traces on adjacent layers; capacitive coupling from other layers can be a problem. Use ground planes to isolate MUX input signal traces from signal traces on other layers.

   Additionally, group and route the digital signals into the PGA as far away as possible from the analog MUX input signals. Most digital signals are fast rise and fall time signals with low-impedance drive capability that can easily couple into the high-impedance inputs of the input MUX channels. This coupling can create unwanted noise that gains up to V_{OUT}.

3. **Input MUX channels and source impedance:** Input MUX channels are high-impedance; when combined with high gain, the channels can pick up unwanted noise. Keep the input signal sources low-impedance (< 10 kΩ). Also, consider bypassing input MUX channels with a ceramic bypass capacitor directly at the MUX input pin. Bypass capacitors greater than 100 pF are recommended. Lower impedances and a bypass capacitor placed directly at the input MUX channels keep crosstalk between channels to a minimum as a result of parasitic capacitive coupling from adjacent PCB traces and pin-to-pin capacitance.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PW (R−PDSO−G20)   PLASTIC SMALL OUTLINE
4040064−5/G 02/11

NOTES: A.   All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M−1994.
         B.   This drawing is subject to change without notice.
         C.   Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
         D.   Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
         E.   Falls within JEDEC MO−153

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
